PRESS RELEASE

Deutsche Bahn orders Gomero's control equipment SIPP

Gomero Group AB, via its German partner Karberg & Hennemann, has received an order for the installation of SIPP, its proprietary connected technology for predictive maintenance and environmentally safe management of oil leakage from transformers. The order derives from the previously signed framework agreement with Deutsche Bahn Energie. Within the framework agreement, the order is the largest to date and worth approximately EURO 200,000.

SIPP is a control equipment for predictive maintenance at transformer stations. SIPP is monitored 24 hours a day, all year round. The control equipment has digital process support for installation and predictive maintenance via a web interface and app, and includes an interface for integration with the customer's business and maintenance system.

The SIPPs that have been ordered will be in operation during the first half of 2022.

"The framework agreement with Deutsche Bahn Energie is of significant strategic importance to us in a large and important market. The order reaffirms that our international growth ambitions are on target. With this contract, Germany may soon become our single largest market", comments Jan-Eric Nilsson, CEO of Gomero.

As society becomes more electrified, the need for predictive maintenance increases. As this trend continues, the maintenance of electricity networks and infrastructure needs to be streamlined and implemented in a way that promotes operational reliability and sustainability.

"SIPP can turn extensive amounts of data into assets that simplify and streamline our customers' everyday lives, while reducing the risks of operational disruptions. In Germany, the requirements for data and operational security in a connected environment are stringent. Therefore, it is gratifying that we are establishing ourselves in a market with orders from large, industry leading companies", concludes Jan-Eric Nilsson.
